WHERE IT GOES

This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Wheel: 200 OD, 20 teeth, 20 mm C45 plate. Each tooth rises
14 mm along the circle and drops straight back to the root.
Hub: 70 mm bar, 44 long, welded on the outer face; bore wheel and
hub 40 with a 12 mm keyway 64 long; set screw M10 in the hub.
Pawl: 16 mm C45 plate, 25 wide at the pivot (40 OD round end),
8 wide at the tip; 25 mm pivot hole; harden the tip.
Pivot: M24 bolt through the pawl, the 40 mm boss and the cheek,
nyloc nut inside. Pivot 130 behind and 130 above the drum centre.
Spring: stainless return spring from the pawl to a 6 mm hole in
the cheek ear, so the pawl always drops into the teeth.
The pawl lets the drum wind rope in and stops it running back.
Fit: the wheel goes on the drum shaft outside the left bearing,
10 mm clear of it; the pawl lies in the same plane.
Check: wind by hand; the pawl clicks into every tooth and holds.

SALTDRAG
